SUMMARY DESCRIPTION

Archaic through the Late Woodland Periods,

Prehistoric occupational debris is distributed over a 1400 foot long by 300 to 500 foot wide area. Excavations conducted by Harry L. Schoff in 1939 and the Archeological Society of Virginia in 1964 determined that well-preserved features exist across the site. Principal occupation at the Elm Hill Archaeological Site dates to the Late Woodland Period (A.D. 800-1600), illustrating close relationships with other tribal societies along the Roanoke, Staunton, and Dan Rivers. Deeper deposits contain remains from the Middle Woodland (500 B.C. - A.D. 800) and Late Archaic Periods (3000 - 1000 B.C.).

The Elm Hill Archaeological Site (44MC78), a prehistoric site dating from the Late

Due to the high density of prehistoric surface debris and occasional burials unearthed by plowing, the site has long been known to local inhabitants as the Indian Field. Prehistoric debris is heavily scattered over an area of at least 1400 feet east-west by 300 to 500 feet north-south.

The first recorded excavation in November 1939 by Harry L. Schoff, of Holcomb, New York, on what was then known as the Elm Hill Plantation, revealed numerous deep pits filled with well-preserved refuse and fifteen burial pits with human skeletons.

Clifford Evans in 1955 included sherds from the Elm Hill Archaeological Site in his <u>Ceramic Study of Virginia Archaeology</u>, placing all of the classified ceramics in the Late Woodland Clarksville Series.

In 1964 the Archeological Society of Virginia conducted investigations on a small portion of the site, excavating forty-six five foot squares oriented east-west in a central trench across the site with a few squares or short lateral trenches dug to the north and south. Cultural debris was found to a depth of 36 inches. The top 12 inches was removed as plowed soil and the deeper undisturbed soil removed in four arbitrary 6 inch levels. Thirty-six pits were uncovered of which nine contained human burials. Scattered postmolds also were encountered. In addition, a wide variety of artifacts made from clay, stone, bone, and shell were recovered. Eaunal remains of bone and shell fish were also abundant. Lithic flakes and Savannah River projectile points (dating to the Late Archaic Period, 3000 - 1000 B. C.) were found in the lowest level. The ceramics were described as being similar to the Late Woodland Clarksville Ware, although after recent re-examination, many of the sherds have been identified as representing Middle Woodland Clements Ware and Late Woodland Gaston Ware. This indicates increased site complexity and suggests that features

The Elm Hill Archaeological Site (44MC78), a prehistoric site in

Virginia, contains stratified deposits dating from the Late Archaic through Late Woodland

Periods which could significantly contribute to the limited research data currently available

Late Archaic projectile points and flakage have

been documented in a stratified context from the lowest tested level of the site. Multiple

Woodland Period occupation is denoted by the presence of preserved strata, pit features,

hearths, and human burials. These strata and features are characterized by dense concentrations of the lithic and ceramic artifacts as well as well-preserved animal bone and shell

fish remains. Such well-preserved data possess significance for Late Archaic through Late

Woodland Period regional studies in chronologies, subsistence systems, settlement patterns
and socio-political/religious organization.

HISTORICAL BACKGROUND

The 15 foot high natural levee at the Elm Hill Archaeological Site has high potential for deeply stratified cultural deposits. Excavations to date have already identified Late Archaic Period artifacts in a stratified context at the lowest tested level of the site. In situ deposits from sites other than rockshelters or caves are rare in Virginia, particularly for the Late Archaic and earlier periods. Such data possess particular significance for late Archaic Period regional studies on chronologies, subsistence systems, and settlement patterns.

Multiple Woodland Period occupation is documented in the presence of preserved strata, pit features, hearths, and human burials. These cultural deposits are associated with dense concentrations of lithic and ceramic artifacts as well as preserved animal bone and shell fish remains. As possibly the last remaining well-preserved major bottom land Woodland Period archaeological site in this area, data contained within cultural deposits at 44MC78 should be particularly significant when compared to earlier excavations by Joffre L. Coe near Roanoke Rapids, North Carolina and Carl F. Miller near Clarksville, Virginia before the John H. Kerr Reservoir and Lake Gaston were inundated. The diversity of Woodland Period cultural deposits at the Elm Hill Archaeological Site contain data likely to be significant to numerous regional studies on such topics as chronologies, subsistence systems, settle-

ELM HILL ARCHAEOLOGICAL SITE, MECKLENBURG COUNTY, VA (44MC78)

Continuation sheet #1 Item number 7,8,9,10

Page 1, 1, 1, 1

7. <u>DESCRIPTION</u>——Archaeological Analysis

and undisturbed strata at the Elm Hill site date to various occupations during the Middle and Late Woodland Periods. The complete lack of European trade goods indicates a pre-A.D. 1600 date for the terminal occupation of the site, although a slightly later radiocarbon date of A.D. 1670 ± 70 was obtained from charcoal from one feature. The earlier Middle Woodland occupation is supported by a radiocarbon date of 520 ± 70 B.C. on charcoal from another feature.

Following the work of the Archaeological Society of Virginia in 1964, two members, John H. Wells from Victoria, Virginia, and Phillip Lewis of Norlina, North Carolina, returned and conducted further investigations. They excavated thirteen five foot squares, encountering heavy concentrations of cultural debris and seventeen pits, including one human burial.

In February 1983 the Virginia Historic Landmarks Commission's Research Center for Archaeology surveyed the site, noting the great density of surface artifacts in the sandy soil and the extremely large size of the site. There was no surface indication of recent disturbances other than plowing. Most of the site thus remains in a good state of preservation.

8. SIGNIFICANCE--Historical Background

ment patterns, and socio-political/religious organization. Of special significance is the range of Middle and Late Woodland Periods ceramics at the Elm Hill Archaeological Site illustrating close cultural affiliation, the nature of which is unknown in detail, with other tribal societies living in a region stretching from the fall line on the Roanoke River to west of the Blue Ridge escarpment in the contiguous areas of Virginia and North Carolina.

VERBAL BOUNDARY DESCRIPTION

JUSTIFICATION

The nominated acreage consists of 12 acres situated on a narrow neck of land.

Boundaries have been defined based upon the distribution of prehistoric artifacts noted through surface examinations and subsurface testing.
