Describe present and historic physical appearance.

Site 44MC511 is situated on the tip of a ridge. This site represents a tobacco related historic farmstead property type and consists of the foundation remains of a large house, a well, a tobacco barn, ordering rooms, and outbuildings of unknown function. Large oaks, ornamental vegetation, large piles of fieldstone, and an old road are also present at the site. The 1940-41 preimpoundment map shows a substantial structure and road in the site area (attached Figure VII-18). This structure probably represents Structure #1. Much of the site is situated on light to moderate slopes. Areas near the lakeshore have been impacted by erosion.

Structure #1 is located in the central portion of the site (see attached Figure VII-17). This structure consisted of a large stone and brick foundation with a cellar and two chimney falls. The foundation measured approximately 35 feet by 35 feet with a central brick and stone load bearing wall dividing the cellar into two halves. This central wall extends from the eastern side of the foundation and cellar to two-thirds the length of the interior. Two brick mounds are present on the western side of the house foundation. These brick piles are approximately 3 feet high and probably represent chimneys; however, no articulated brick was visible.

A recently filled well is located approximately 40 feet to the east of Structure #1. It appears that debris from the main house or possibly from another structure were used to fill in the well.

At least four outbuildings were located. The remnants of a double flue tobacco barn (Structure #2) were present on the moderate slopes south of the main house. This foundation measured approximately 18 by 18 feet, consisting of granitic stone, with the two intact stone and slate flues situated on the southern wall.

Structure #3 was located northeast of Structure #1. A 15 by 15 foot fieldstone foundation line and brick scatter serves to delineate this structure. No associated features or artifacts were observed which could aid in determination of the function of this structure.

Architect/Builder
unknown

State significance of property, and justify criteria, criteria considerations, and areas and periods of significance noted above.

Site 44MC511 (a nineteenth century farmstead archaeological site) contains surface elements, including foundations, wall remnants, and piers, from a number of houses/structures, chimney bases, yard areas delimited by ornamental vegetation, and a well. It is highly probable that subsurface features such as cellars, trash pits, and activity area middens are also present. The site appears to have been occupied continuously from the early-middle 1800s until its purchase by the federal government in the 1940s. There is no evidence of impact by plowing, timbering, or heavy machinery use at the site. Some above-ground scavenging (i.e., removal of walls, roofing materials, etc.) may have been carried out after federal purchase, but this does not appear to have damaged archaeological deposits present.

Site 44MC511 shares the fieldstone pier foundation and brick chimney construction of other historic farmstead archaeological sites in the [redacted] project area, and is considered significant under Criteria 1, 2, and 5, outlined in Section H of the [redacted] multiple property nomination. It is anticipated that archaeological study of 44MC511 would contribute significant information for all the research questions presented in Section F (Part III) of the [redacted] multiple property nomination for this property type (farmstead).

Cedar Grove is locally known as a "plantation." The site has been described here as a farmstead because the number of outbuildings is similar to other farmstead sites, and because no slave occupation areas were identified. Further archaeological study at the site might reveal such areas, and might allow significant understanding of the range of settlement types and status relationships that might be expected between large plantations (at one end of the range) and typical farmsteads (at the other end).

CONTINUATION SHEET**

SECTION 7 PAGE 1

CEDAR GROVE (44MC511)
MECKLENBURG COUNTY, VIRGINIA

Structure #4 was located approximately 250 feet from Structure #1, very near to the present lakeshore. Due to its exposed position near the beach, the structure has been partially eroded. A surface artifact scatter was observed and collected nearby. The western and southern portions of the structure maintain a partially intact stone foundation. The eastern portion the structure consists of a three foot high concentration of stone with no discernable articulation. Due to the lack of existing structural elements, the function of this foundation could not be determined.

The remains of a shed-like structure (Structure #5) were present north of Structure #1, near Structure #3. This foundation was composed of rough cut field stone piers. Situated on a slight slope, articulated stone piers (as high as three tiers) on the northern side were used to compensate for the change in elevation. The piers on the southern portion of the structure are comprised of flat fieldstone, nearly level with the ground.

The remains of three tobacco ordering rooms (Depression #1, #2, and #3) were also present on the slopes near the Structure #1 area. Except for a loose scattering of stone (probably used for piers) no structural elements were present. These depressions are typical of others found in the region.

Two large field stone piles of unknown function were located near the shoreline. The function of these piles is unknown. A concentration of late nineteenth to twentieth century ceramics and glass was found eroding at the northeast shoreline. A surface collection was made of artifacts along the shoreline areas.

The apparent residential house at Cedar Grove was possibly occupied for at least 100 years, from the 1840s to the 1940s, as indicated by land ownership records (see Table VII-3). Study of Cedar Grove to date has involved detailed mapping of structural debris. No test units have been excavated. Because of the integrity of surface features, it is very likely that subsurface features are present. Artifact data from surface collections include pearlware, indicating early 1800s occupation at the site; other ceramics (whiteware, yellowware) noted have a long date range in the 1800s and early 1900s.

The farm complex was used for tobacco agriculture into the twentieth century, and probably served as a tobacco farm from its inception. It may be one of the few archaeologically represented, antebellum farmsteads known in the project area. The site has intact architectural features from the house and numerous outbuildings/dependencies. Artifact density is moderate to high (based on surface collections).

SECTION 8 PAGE 6

CEDAR GROVE (44MC511)
MECKLENBURG COUNTY, VIRGINIA

The research potential of 44MC511 is high due to its intact condition and the presence of intact architectural remains. The preservation of much of the various structure foundations indicates that there is high potential for preservation of subsurface trash pits, posts, or other features that are likely to have been part of the site's occupation. The presence of above-ground wall, foundation, and chimney ruins is a common indicator of high-integrity subsurface archaeological deposits. An example of such ruins indicating archaeological deposits with high integrity is found in the detailed archaeological field investigation of Brunswick Town (Brunswick, North Carolina) by Stanley South (1977:47ff). Above-ground foundation remnants noted there allowed identification and study of well preserved archaeological deposits from several Colonial-era houses, particularly the Hepburn-Reonalds House (see South 1977:155). Journey et al. (1983) showed the potential for farmstead/homestead ruins as indicators of subsurface archaeological deposits related to early twentieth century tenant farm sites in Texas. Journey et al. (1983) demonstrated patterns of yard use and outbuilding structure location through study of sheet middens associated with house ruins; the presence of house ruins was the major indicator used by Juney et al. (1983) to begin archaeological study.

Site 44MC511 has the archaeological attributes which equate with eligibility under Criterion (d) as an individual property; however, the research potential of 44MC511 will be increased by its inclusion within the Kerr Reservoir multiple property nomination.
